

SUCCESS BUILT UPON RESULTS

A 1987 follow up survey of patients diagnosed with lumber disc herniation who participated in DMT: Decompression Mobilization Therapy in 1983 was completed to determine the effectiveness of our back program.

The diagnosis was confirmed by CT scan or myelogram.

All patients had previously seen another physician and more had seen several before starting the program. 56% of the patients were male, 44% female. Average age was 43.5 years. After discharge from active medical treatment, 96% of the patients are continuing the DMT program at the home level.
